ENGINEERING WITH AI

From generated output to accepted change

Follow the decisions that connect intent, implementation, and evidence. Compare four AI-oriented development methods through a common set of engineering questions, then apply them to a synthetic multi-tenant approval service.

Explore specification ownership, persistent context, human decision rights, verification freshness, and recovery after a failed handoff. Worked examples and reader exercises turn each distinction into a question a team can inspect.

For developers, technical leads, and architects building a disciplined practice with coding agents.

FIRST EDITION / 2026
